

WINDSHIELDS

In order to reach the excellence in quality that you deserve, AB Inflatables keeps searching for the best materials and components for our boats. That is the case of the windshields we have been using in the last months on our VST models. They, as well as most of our parts, are made in the US. Although they are of the best quality in the market, there are some basic precautions that should be taken into consideration for them to last longer in perfect conditions:

CLEANING THE WINDSHIELD:

- Do not use products that contain Ammonia, such as glass cleaners and similar. Even glass cleaners that do not list ammonia as one of their ingredients, contain some of it, just enough to damage the windshields.
- For proper cleaning, use only plain soap and water.
- Clean the windshield on a regular basis. According to the manufacturer, not cleaning the windshield for long periods of time causes the dirt and salt to interact with the molecular makeup of the acrylic and can cause crazing.

MECHANICAL STRESS

- Crazing of the material, apparently for no reason, might have actually be caused by being hit by a hard jolt on the edge of the windshield.

You can be sure we are using the best material there is for an acrylic windshield, which is why we can be confident that being cautious with the point above, it is extremely unlikely, not to say impossible, that there is a damage on one of these pieces caused by fabrication defects.
